

Signal-like ROIs: V3 axon criterion; band-passed 1-30 s best dF/F on a 5 Hz grid; sessions with < 8 signal-like ROIs have no spatial test. Marker shape = animal, filled = unflagged, hollow = flagged (not pooled); black bars = mean of per-animal means ± 95% hierarchical bootstrap CI. Nearby ROIs may be fragments of one axon or share local neuropil / z-motion: panel g shows a spatial relationship, not a topographic map.
