

Orange = 11-06 windows. Windows: 3 min, behaviour and axons band-passed 1-30 s, at least 90% valid frames. Marker shape = animal (circle RB24, square RB23, triangle RB22);
filled = unflagged, hollow = flagged (not pooled); unflagged pooled values = mean of per-animal means with 95% hierarchical bootstrap CI. c, d: is the lack of coupling on 11-06 a lack of behavioural range?
e-g: where the evidence for a pure arousal signal is weaker (tracking agreement between channels, common-mode with rejected ROIs, brain shift).
